Group Assignment (INFOMCEC 2026-2027 Midterm and Final Term

Criteria	No-Pass	Pass
Midterm Demo (Pass/No Pass)	Demo does not work; did not correctly implement the Temperature Observability service based on the functional and non-functional requirements	Demo works; Provides consistent **data throughout "Data Consistency"** part of the demo; correctly implements the Temperature Observability service based on the **functional and non-functional requirements.**

Criteria	Poor	Fair	Good	Excellent
Final Demo[12] (70%)	Demo does not work; did not correctly implement the Temperature Observability service based on the functional and non-functional requirements	Demo works; Provides consistent **data throughout "Data Consistency"** part of the demo; correctly implements the Temperature Observability service based on the **functional and non-functional requirements.**	Demo works; **Passes the variable workload stress test** and maintains a **notification latency of < 10 second** and **provides consistent data** in the Temperature Observability service (based on the **functional and non-functional requirements**).	Demo works; **Passes the variable workload stress test** and maintains a **notification latency of < 10 second** and **provides consistent data** in the Temperature Observability service (based on the **functional and non-functional requirements**); Can **keep up with the variable HTTP workload** applied to their Temperature Observability service.
Criteria	**Poor**	**Fair**	**Good**	**Excellent**
Architecture Assessment[1][3] (30%)	Architecture does not **consider** and implement all **interfaces of Temperature Observability service** and does not pass the **data consistency principles**.	Architecture considers splitting microservice into one/or/more services based on **separation of concerns principles**; Architecture considers and implements all interfaces of Temperature Observability microservice; passes data consistency part of the demo.	Architecture shows that one/or/more split services has distinct responsibility and also shows **separation of concerns based on scalability**, passes the data consistency part of the demo while considering and implementing all interfaces of the microservice.	Can pinpoint **different bottlenecks in the architecture when the load is applied** and also passes the data consistency part of the demo; Makes sure to consider and implement interfaces of Temperature Observability microservice are implemented with one/or/more split services having distinct responsibility, and shows separation of concerns based on scalability.

Note:

(1) As explained earlier, Students who fail in the midterm demo exam will get a resit chance in the final demo exam.
(2) Any other/additional demo resits other than midterm and final demo remain at the discretion of the course coodinator.
(3) In case of additional resit chance other than midterm and final demo provided to students, will only fetch them a passing grade for demo, in order to maintain fariness to all students, hence will not be eligible for good and excellent grades
In such case the passing grade, also applies to Architecture Assesment.

[1] **Remark 1:** Demo should work for the **group assignment to be graded**.
[2] **Remark 2**: In case the lecturer finds out (at own or group members initiative), that a group member is not contributing to the assignment, can result into a lower grade for the individual compared to actively contributing group members.
[3] **Remark 3**: During architectural assessment, questions can be redirected to any group member, hence individual knowledge of each team member about the assignment will also be evaluated. Similarly, as demo, grades for individual team members can differ depending upon their answers and knowledge about the group assignment,
